

Harsh Bhanushali

Agentic AI Developer

harshbhanu0709@gmail.com | 7041132742 | Vapi | <https://harshbhanushali26.github.io/> | [GitHub](#) | [LinkedIn](#)

Summary

Agentic AI Developer specializing in autonomous systems, RAG pipelines, and multi-agent workflows in Python — built entirely without relying on frameworks. Experienced in backend engineering and scalable system design from a full-stack internship.

Experience

Symbiosis Systems & Services Pvt. Ltd.

Full Stack Developer Intern

Vapi
January 2024 - September 2024

- Built and deployed 3 web applications using ASP.NET, SQL Server, and Bootstrap — delivered 20+ features across 15+ backend modules, improving team workflow efficiency by 30% and adopted by 15+ daily users.
- Rebuilt the Impex application from scratch under live client requirements — owned 4–5 modules, implemented RBAC and automated workflows, and maintained code integrity across a 3–5 member team.

Projects

AI Agent Engine

February 2026 - Present

- Built an autonomous AI agent that skips the LLM entirely for most queries — a multi-layer pipeline handles the majority deterministically, calling the model only when reasoning is actually needed.
- Built a structured agent pipeline with automatic retry and replanning on failure — session-level tracking across every decision type gives full visibility into what the agent did and why.

hArI

March 2026 - Present

- Built and deployed a document intelligence app — PDFs answered via semantic retrieval, CSVs via LLM-generated data operations, both under one conversational interface with intelligent query routing.
- All retrieval and LLM orchestration built from scratch — conversation memory persists across turns with automatic summarization when context fills.

Multi-Agent Research Pipeline

April 2026 - Present

- Built a multi-agent research system where 6 agents each own one stage — search, scrape, summarize, critique, synthesize — with a lead agent handling routing, sequencing, and gap-fill loops.
- Model routing adapts to task type with automatic fallback when quota hits — state persisted after every phase so the pipeline can resume mid-run.

NextSteps — Career Path AI App

March 2026 - Present

- Built an AI career planning app that analyzes a resume against a job description or URL and delivers a full gap analysis, skill mapping, and personalized roadmap in under 5–8 minutes.
- Designed for real-world use with a clean separation between parsing, analysis, and output generation — no hardcoded assumptions about resume structure or job format.

DevMind — MCP Server

May 2026 - Present

- Built a local MCP server exposing 6 developer tools — file ops, Python execution, and JSON utilities — all accessible to any MCP-compatible client.
- Designed HITL confirmation into write and run actions, and solved a non-obvious subprocess stdin isolation bug that silently breaks most naive MCP server implementations.

Education

Government Engineering College, Modasa

Modasa • September 2020 - May 2024

GATE 2025 — Computer Science & Engineering (Qualified)

Bachelor of Engineering in Information Technology • 8.23

Skills

AI & Agents

Agentic AI, RAG, LLM, Tool-Calling, Gemini, ChromaDB, Groq

Languages & Libraries

Python, SQL, Numpy, Pandas, SentenceTransformer, LangChain

Tools & Frameworks

Streamlit, Fast API, Git, VS Code, CLI, LangGraph, MCP
